

Basic Life Support Exam A

(25 questions)

Please do not mark on this exam. Record the best answer on the separate answer sheet.

- 1. While performing high-quality CPR on an adult, what action should you ensure is being accomplished?
 - A. Maintaining a compression rate of 90 to 120/min
 - B. Placing hands on the upper third of the sternum
 - C. Allowing the chest to recoil 1 inch
 - D. Compressing to a depth of at least 2 inches

Use this scenario to answer the next 2 questions:

A 53-year-old woman collapses while gardening. She is unresponsive, is not breathing, and does not have a pulse. A neighbor, who is an emergency medical technician, rushes to her with an AED.

- 2. When the AED arrives, what is the first step for using it?
 - A. Apply the pads to the patient's chest
 - B. Clear the patient
 - C. Turn on the AED
 - D. Press the shock button
- 3. After the AED pads are attached to the victim's bare chest, the AED detects ventricular fibrillation. What is the next step when using an AED?
 - A. Check the victim for a carotid pulse
 - B. Follow the AED prompts
 - C. Clear the patient
 - D. Press the shock button
- 4. What should you do if you need to use an AED on someone who has been submerged in water?
 - A. Do not move the victim, and do not use the AED
 - B. Pull the victim out of the water, but do not use the AED
 - C. Pull the victim out of the water, and wipe the chest
 - D. Do not pull the victim out of the water, but wipe the chest before placing pads
- 5. How can rescuers ensure that they are providing effective breaths when using a bag-mask device?
 - A. Observing the chest rise with breaths
 - B. Delivering breaths guickly and forcefully
 - C. Always having oxygen attached to the bag
 - D. Allowing air to release around the mask

- 6. What ratio for compressions to breaths should be used for 1-rescuer infant CPR?
 - A. 5 compressions to 1 breath
 - B. 20 compressions to 2 breaths
 - C. 15 compressions to 2 breaths
 - D. 30 compressions to 2 breaths
- 7. What is a consideration when you are using an AED?
 - A. You should never remove a transdermal medication patch before applying AED pads
 - B. On a hairy chest, the pads may not stick and may fail to deliver a shock
 - C. AEDs can be used while a victim is submerged in water
 - D. You should not use an AED on someone with an implanted pacemaker

A 9-year-old child has suddenly collapsed. After confirming that the scene is safe, a single rescuer determines that the child is in cardiac arrest, shouts for nearby help, and activates the emergency response system. He immediately begins performing high-quality CPR. Two additional rescuers arrive to assist in the resuscitation attempt.

- 8. What actions should occur next, to support a team-based resuscitation attempt?
 - A. 2 rescuers alternate using the AED and giving breaths
 - B. 1 rescuer gives CPR while the other 2 wait for advanced life support to arrive
 - C. 2 rescuers alternate giving high-quality chest compressions
 - D. 2 rescuers operate the AED while the third rescuer gives breaths
- Two rescuers begin high-quality CPR while the third rescuer leaves to get the AED. What action supports 2-rescuer CPR?
 - A. Alternating the AED role every 2 minutes
 - B. Alternating the compressor role every 2 minutes
 - C. Alternating giving rescue breaths every 3 cycles
 - D. Alternating giving shocks every 3 cycles
- 10. "Members of the team know their boundaries and ask for help before the resuscitation attempt worsens." Match this statement with the most appropriate element of team dynamics listed.
 - Knowledge sharing
 - B. Summarizing and reevaluation
 - C. Constructive intervention
 - D. Knowing your limitations
- 11. A victim with a foreign-body airway obstruction becomes unresponsive. What is your first course of action?
 - A. Start CPR, beginning with chest compressions
 - B. Roll the victim over and perform back blows
 - C. Perform abdominal thrusts
 - D. Perform blind finger sweeps

- 12. Why is defibrillation important?
 - A. It prevents rearrest from occurring
 - B. It is not important for cardiac arrest
 - C. There is a 100% success rate in regaining a normal cardiac rhythm
 - D. It can restore a regular cardiac rhythm
- 13. You witness someone suddenly collapse. The person is unresponsive, you hear gasping sounds, and there is no pulse. What should you do next?
 - A. Begin CPR; the gasps are not normal breathing
 - B. Give rescue breaths only; the gasps are not normal breathing
 - C. Monitor the patient; the gasps are considered normal breathing
 - D. Begin CPR, even though gasping is normal breathing

A middle-aged man collapses. You and a second rescuer go to the victim and find that he is unresponsive, is not breathing, and does not have a pulse.

- 14. Which action is most likely to positively impact this victim's survival?
 - A. Performing high-quality CPR
 - B. Ensuring scene safety
 - C. Providing rescue breaths
 - D. Checking the pulse frequently
- 15. You and another rescuer begin CPR. After a few cycles, you notice the chest compression rate is slowing. What should you say to offer constructive feedback?
 - A. "You need to compress at a rate of 80 to 120 per minute."
 - B. "You need to compress at a rate of at least 120 per minute."
 - C. "You need to compress at a rate of 100 to 120 per minute."
 - D. "You need to compress at a rate of at least 100 per minute."
- 16. How do you perform chest compressions when providing high-quality CPR to a child victim?
 - A. By compressing the chest at least one third the depth of the chest, about 2 inches (5 cm)
 - B. By compressing the chest at least one fourth the depth of the chest, about 1.5 inches (4 cm)
 - C. By compressing the chest at least two thirds the depth of the chest, about 4 inches (10 cm)
 - D. By compressing the chest at least one half the depth of the chest, about 3 inches (8 cm)
- 17. When performing CPR on an unresponsive choking victim, what modification should you incorporate?
 - A. There are no modifications to CPR for an unresponsive choking victim
 - B. You do not give breaths to an unresponsive choking victim
 - C. Each time you open the airway, look for the obstructing object
 - D. Attempt a jaw thrust instead of a head tilt-chin lift

An 8-month-old infant is eating and suddenly begins to cough. The infant is unable to make any noise shortly after. You pick up the infant and shout for help.

- 18. You have determined that the infant is responsive and choking with a severe airway obstruction. How do you relieve the airway obstruction?
 - A. Encourage the infant to cough
 - B. Give sets of 5 back slaps and 5 chest thrusts
 - C. Begin 2 thumb-encircling hands chest compressions
 - D. Give abdominal thrusts
- 19. Which action do you perform to relieve choking in an unresponsive infant?
 - A. Perform CPR, and look in the mouth for the obstructing object
 - B. Give sets of 5 back slaps and 5 chest thrusts
 - C. Give sets of 5 abdominal thrusts and 5 back slaps
 - D. Attempt a blind finger sweep when giving breaths to remove the obstructing object
- 20. Which victim requires high-quality CPR?
 - A. A victim who is unresponsive, has a strong pulse, and is breathing adequately
 - B. A victim who is unresponsive with no normal breathing and no pulse
 - C. A victim who is responsive, has a pulse, and is having trouble breathing
 - D. A victim who is responsive, is having trouble breathing, and has a pulse less than 60/min
- 21. "The team functions smoothly when all team members know their positions, functions, and tasks during a resuscitation attempt." Match this statement with the most appropriate element of team dynamics listed.
 - A. Clear roles and responsibilities
 - B. Knowing your limitations
 - C. Constructive intervention
 - D. Mutual respect
- 22. Why is allowing complete chest recoil important when performing high-quality CPR?
 - A. There will be a reduction of rescuer fatigue
 - B. It will reduce the risk of rib fractures
 - C. The heart will adequately refill between compressions
 - D. The rate of chest compressions will increase

A 67-year-old man is found unresponsive, not breathing, and without a pulse. You and a second rescuer begin performing high-quality CPR.

- 23. When should rescuers switch positions during CPR?
 - A. Never switch rescuers, and maintain current roles
 - B. Switch rescuers at 5-minute intervals
 - C. Switch rescuers about every 2 minutes
 - D. Switch rescuers when placing the AED pads
- 24. You notice the person giving chest compressions is not allowing for complete chest recoil. What is your next course of action?
 - A. Stand back and await direction from the team leader
 - B. Take over leadership and give direction
 - C. Immediately take over chest compressions
 - D. Tell the compressor you notice decreased chest recoil
- 25. Rapid defibrillation is a link in the adult Chain of Survival. Why is this important to survival?
 - A. It prevents cardiac arrest
 - B. It prevents respiratory arrest
 - C. It provides normal respiration
 - D. It eliminates the abnormal heart rhythm
